Applications, Vol. 96, No. 1

AN 1996-024402 JAPIO

AB PURPOSE: To prevent an erroneous operation by electromagnetic wave or exter nal light, and precisely detect the passing of game ball by making an operating piece pushed into a switch housing part when the ball passes the through-hole of a switch case, thereby a switch is brought into non-conductine stake and the passing of the ball is detected.

CONSTITUTION: When no game ball passes a through-hole 30, one end of an operating piece 70 supported in the inner part of a switch housing part 40 is in the state capable of protruding into the through-hole 30, and the energizing force of a torsion spring 60 acts on the free end part on the other end to energize the operating piece 70 in the protruding direction. Both ends of the torsion spring 60 come into contact with a fixed pin 54 and a contact pin 53 in this state to hold the conductive state between the connecting terminals 51, 52 of a base 50. When a game ball passes the through-hole 30, the operating piece 70 is pushed against the energizing force of the torsion spring 60. Thus, one end of the torsion spring 60 is pushed in and separated from the contact pin 53 to bring the connecting terminals 51, 52 into the non-conductive

state, thereby the passing of the game ball can be detected.

A sodium channel enriched preparation was obtained from human brain. AB Human sodium channel appeared as a heterocomplex peptide alpha beta 1 beta 2. Functional properties of the protein were maintained since, after reconstitution into liposomes, ion fluxes were sensitive to sodium channel specific toxins and to membrane potential. Moreover, the reconstituted protein showed a well defined ionic selectivity.

AB EP 293808 A UPAB: 19930923

The circuit has a logic circuit (12) with two inputs connected to receive a control clock signal (Phi G) and an input signal (Vin) a two conductine type transistors (P11 P12) are connected in series between a power supply terminal and a node. The first transistor (P11) has a gate connected to receive an output signal of the logic circuit. The other transistor (P12) has a gate connected to receive the control clock signal.

A third transistor (N11) of a different conductive type connects the first node and the second power supply terminal together.

The transistor gate is connected to receive the output signal of the logic circuit.

USE/ADVANTAGE - Latch circuit or swift register in the output stage of the memory.

#### ABEQ US 4856034 A UPAB: 19930923

The semiconductor integrated circuit consists of a three-valued logic circuit connected to receive an output signal of a logic circuit to receive at one input a control clock signal and at the other input an input signal. A flip-flop circuit is composed of a clocked inverter to receive the output signal of the three-valued logic circuit, and another inverter.

ABEQ EP 293808 B UPAB: 19931123

A semiconductor integrated circuit, comprising: a logic circuit (12) consisting of a NOR gate (72) or a NAND gate (82) and having a first

and a second input connected to receive a control clock signal (G) and an input signal (Vin), respectively; first and second transistors (P11, P12) of a first conductivity type connected in series between a first power supply terminal (Vcc) and a first node (1), said first transistor (P11) having a gate connected to receive an output signal of said logic circuit, and said second transistor (P12) having a gate connected to receive the control clock signal; a third transistor (N11) of a second conductivity type connected between said first node and a second power supply terminal (Vss) and having a gate connected to receive the output signal of said logic circuit; fourth and fifth transistors (P13, P14) of the first conductivity type connected in series between said first power supply terminal and a second node (2) connected to said first node, said fourth transistor (P14) having a gate connected to receive the output signal of said logic circuit, and said fifth transistor (P13) having a gate connected to a third node (3); sixth and seventh transistors (N14, N13) of the second conductivity type connected in series between said second power supply terminal and said second node, said sixth transistor (N14) having a gate connected to receive the clock signal, and said seventh transistor (N13) having a gate connected to said third node; an eighth transistor (P15) of the first conductivity type connected between said third node and said first power supply terminal and having a gate connected to said second node; and a ninth transistor (N15) of the second conductivity type connected between said third node and said second power supply terminal, and having a gate connected to said second node; an output signal (Vout) of said semiconductor integrated circuit being taken from at least one of said second node and said third node. The invention relates to agents for treating human diseases which are based on substances that specifically influence the binding of .beta.-catenin with LEF-1/TCF transcription factors, APC or conductin/axin. The invention particularly relates to the identification and use of hydrophobic pockets on the mol. surface in the proximity of the essential binding points for the binding partners of .beta.-catenin with the aim of optimizing these substances. The invention also relates to the use of the substances, preferably for treating tumors, e.g. colon cancers and melanomas, or for regenerating tissue and promoting hair growth.

AB Colorectal cancer (CRC) with defective DNA mismatch repair (MMR) is assocd. with alterations one of several DNA MMR genes. Here we show that AXIN2 encoding a Wnt signaling component, is mutated in 11 of 45 CRC with defective MMR. We tested the functional importance of AXIN2 mutations in the development of CRCwith defective MMR in a TCF reporter assay. Our findings now provide a link between defective MMR and the activation of TCF-dependent transcription, as mutations in AXIN2 alter the APC

pathway.

Interactions between .beta.-catenin and LEF-1/TCF, APC and conductin/axin are essential for wnt-controlled stabilization of .beta.-catenin and transcriptional activation. wnt signal transduction pathway is important in both embryonic development and tumor progression. We identify here amino acid residues in .beta.-catenin that distinctly affect its binding to LEF-1/TCF, APC and conductin. These residues form sep. surface clusters, termed hot spots, along the armadillo superhelix of .beta.-catenin. We also show that complementary charged and hydrophobic amino acids are required for formation of the bipartite .beta.-catenin-LEF-1 transcription factor. Moreover, we demonstrate that conductin/axin binding to .beta.-catenin is essential for .beta.-catenin degrdn., and that APC acts as a cofactor of conductin/axin in this process. Binding of APC to conductin/axin activates the latter and occurs between their SAMP and RGS domains, resp.

The wnt signal transduction pathway is A review, with 72 refs. AB involved in various differentiation events during embryonic development and leads to tumor formation when aberrantly activated. The wnt signal is transmitted to the nucleus by the cytoplasmic component .beta.-catenin: in the absence of wnts, .beta.-catenin is constitutively degraded in proteasomes, whereas in the presence of wnts .beta.-catenin is stabilized and can assoc. with HMG box transcription factors of the LEF/TCF family. The LEF/TCF/.beta.-catenin complexes activate specific wnt target genes. In tumors, .beta.-catenin degrdn. is blocked by mutations of .beta.-catenin or of the tumor suppressor gene product APC. As a consequence, .beta.-catenin is stabilized, constitutive complexes with LEF/TCF factors are formed, and oncogenic target genes, such as c-myc, cyclin D1, and c-jun, are activated. control of .beta.-catenin is a major regulatory event in normal wnt signaling and during tumor formation. It has been found that a multiprotein complex assembled by the cytoplasmic component conductin induces degrdn. of cytoplasmic .beta.-catenin. The complex includes APC, the serine/threonine kinase GSK3.beta., and .beta.-catenin, which bind to conductin at distinct domains. In colon carcinoma cells, forced expression of conductin down-regulates .beta.-catenin, whereas in normal cells mutants of conductin that are deficient in complex formation stabilize .beta.-catenin. Fragments of APC that contain a c nductin-binding domain also block .beta.-catenin degrdn. In Xenopus embryos, conductin inhibits the wnt pathway. In situ hybridization anal. shows that conductin is expressed in various embryonal tissues known to be regulated by wnts, such as the developing brain, mesenchyme below the epidermis, lung mesenchyme, and kidney. It is suggested that conductin

controls wnt signaling by assembling the essential components of the .beta.-catenin degrdn. pathway. Alterations of conductin function may lead to tumor formation.

PRIORITY APPLN. INFO.:

Columns, filters, cannulas, etc. contg. substrates coated with specific antibodies can be used during plasmapheresis to remove pathogenic cytokines such as tumor necrosis factor (TNF), anti-TNF, fragments of TNF or anti-TNF, or TNF transport proteins from blood, plasma, or tissues. The substrates may addnl. be coated with antibodies to microbial or viral pathogens or mixts. of pathogens as well as to polysaccharide antigens, viral capsids, microbial antigens, reverse transcriptase, endothelin, protein A, etc. Selective removal of these pathogens, antigens, proteins, etc. leaves all normal plasma components unchanged and obviates the need

for supplementation of the plasma with these components. Suitable

substrates include polymers, polymer-coated metals, cellulose derivs., starch, and Sepharose; these may be derivatized for covalent binding of the pathogens or pathogenic mols. Thus, Escherichia coli pyelonephritis was successfully treated by plasmapheresis coupled with columns loaded with anti-TNF-.alpha. for 14 days, 4 h/day, as detd. by decreases in plasma TNF-.alpha. levels and colony counts in urine cultures.

AB A review with 37 refs. The structure of .beta.-catenin is described. .beta.-Catenin accumulates in colon cancer and malignant melanoma. .beta.-Catenin is degraded by the ubiquitin/proteasome system. Axin (conductin) possesses regulators of G protein signaling (RGS) for binding APC at N-terminus, GSK-3.beta. and .beta.-catenin binding domains at central region, and DIX region at C-terminus. Wnt protein releases .beta.-catenin from the Axin complex.

AB A review with 90 refs. Wingless/Wnt signaling directs cell-fate choices during embryonic development. In Drosophila, Wingless signaling mediates endoderm induction and the establishment of segment polarity in the developing embryo. The fly Wingless cascade is strikingly similar to the vertebrate Wnt signaling pathway, which controls a no. of key developmental decisions such as dorsal-ventral

patterning in Xenopus. Factors of the TCF/LEF HMG domain family (Tcfs) have recently been established as the downstream effectors of the Wingless/Wnt signal transduction pathways. Upon Wingless/Wnt signaling, a cascade is initiated that results in the accumulation of cytoplasmic .beta.-catenin (or its fly homolog, Armadillo). There is also a concomitant translocation of .beta.catenin/Armadillo to the nucleus, where it interacts with a specific sequence motif at the N terminus of Tcfs to generate a transcriptionally active complex. This bipartite transcription factor is targeted to the upstream regulatory regions of Tcf target genes including Siamois and Nodal related gene-3 in Xenopus, engrailed and Ultrabithorax in Drosophila via the sequence-specific HMG box, and mediates their transcriptional activation by virtue of transactivation domains contributed by .beta.-catenin/Armadillo. the absence of Wingless/Wnt signals, a key neg. regulator of the pathway, GSK3.beta., is activated, which mediates the downregulation of cytoplasmic .beta.-catenin/Armadillo via the ubiquitin-proteasome pathway. In the absence of nuclear .beta.-catenin, the Tcfs recruit the corepressor protein Groucho to the target gene enhancers and actively repress their transcription. An addnl. corepressor protein, CREB-binding protein (CBP), may also be involved in this repression of Tcf target gene activity. Several other proteins, including adenomatous polyposis coli (APC), GSK3.beta., and Axin/ Conductin, are instrumental in the regulation of .beta.-catenin/Armadillo. In APC-deficient colon carcinoma cell lines, .beta.-catenin accumulates and is constitutively complexed with nuclear Tcf-4. A proportion of APC wild-type colon carcinomas and melanomas also contains constitutive nuclear Tcf-4/.beta.-catenin complexes as a result of dominant mutations in the N terminus of .beta.-catenin that render it insensitive to downregulation by APC, GSK3.beta., and Axin/Conductin. This results in the unregulated expression of Tcf-4 target genes such as c-myc. Based on the established role for Tcf-4 in maintaining intestinal stem cells it is likely that deregulation of c-myc expression as a result of constitutive Tcf-4/.beta.-catenin activity promotes uncontrolled intestinal cell proliferation. This would readily explain the formation of intestinal polyps during colon carcinogenesis. Similar mechanisms leading to deregulation of Tcf target gene activity are likely to be involved in melanoma and other forms of cancer. (c) 2000 Academic Press.

We have identified a novel Drosophila homolog of APC, E-APC, which is similar to but differs in several respects from D-APC. The E-APC cDNA encodes a protein of predicted 1067 amino acids, with 7 armadillo repeats, 2 copies of the 15-amino acid repeat, 5 copies of the 20-amino acid repeat, and 1 Axin/conductin binding site. E-APC directly interacts with D-Axin and Armadillo (Arm, the Drosophila homolog of .beta.-catenin) in vitro, destabilizes

intracellular .beta.-catenin, and suppresses .beta.-catenin/TCF-regulated transcription in APC-/- colon cancer cells. The E-APC mRNA is ubiquitously expressed throughout all developmental stages in Drosophila. Our findings suggest that E-APC may be universally involved in the regulation of the Wingless signaling pathway by down-regulating the level of Arm in Drosophila.

A review with 167 refs. is given. .beta.-Catenin plays a structural role in cell adhesion by binding to cadherins at the intracellular surface of the plasma membrane and a signaling role in the cytoplasm as the penultimate downstream mediator of the wnt signaling pathway. The ultimate mediator of this pathway is a nuclear complex of .beta.-catenin acting as a coactivator with lymphoid enhancer factor/T cell factor (Lef/Tcf) transcription factors to stimulate transcription of a variety of target genes. Signaling through .beta.-catenin is regulated by modulating its degrdn. and nuclear translocation. In the absence of an activating signal, phosphorylation of .beta.-catenin by glycogen synthase kinase 3 (GSK3) acting in conjunction with adenomatous polyposis coli and axin/ conductin causes .beta.-catenin to interact with the .beta.-transducin repeat-contg. protein which results in its ubiquitination and degrdn. Signaling from the wnt pathway activates dishevelled which, in an as yet undefined manner, inhibits the activity of GSK3 resulting in an increase in the cytoplasmic free pool of .beta.-catenin, and translocation into the nucleus. The integrin-linked kinase (ILK) pathway also activates .beta.-catenin-Lef/Tcf signaling. ILK phosphorylates CiSK3 to inhibit its activity and translocates .beta.-catenin into the In addn., ILK downregulates the expression of E-cadherin and upregulates Lef-1 expression. In the final step of the .beta.-catenin-Lef/Tcf signaling pathway, nuclear .beta.-catenin binds pontin52-TATA binding protein and displaces Groucho-related gene or CREB-binding protein corepressors from Lef/ Tcf resulting in stimulation of transcription. During development, .beta.-catenin-Lef/Tcf signaling is involved in the formation of dorsal mesoderm and dorsal axis. Furthermore, defects in the .beta.-catenin-Lef/Tcf pathway are involved in the development of several types of cancers.

C.beta.-catenin is a central mol. of the Wnt signal path. AB Increasing .beta.-catenin in the cell leads to its translocation into the cell nucleus and to its interaction with transcription factors of the LEF-1/TCF family. This can lead to colonic cancers and melanomas (oncogenic signal path). However, .beta.-catenin also interacts with the tumor-suppressor genes APC, conductin, and E-cadherin, which have a contrary effect on the cell (antioncogenic effect). derived from LEF-1-/TCF-4 transcription factors and analogous mols. can be used in the treatment of tumors, esp. colonic These peptides and analogous mols. cancers and melanomas. influence the interaction between .beta.-catenin and LEF-1/TCF. peptides comprise parts of the LEF-1/TCF-4 transcription factors and variants and mutations thereof, preferably the 10-40 N-terminal amino acids of LEF-1 or TCF-4, as well as peptides derived from the armadillo region of .beta.-catenin which were identified as interaction domains with LEF-1/TCF, APC, conductin, and E-cadherin. The peptides constituting interaction domains with APC or conductin can increase the concn. of .beta.-catenin in

the cell. These last mols. can be used to influence the formation of tissues and organs, e.g. to promote hair growth.

AB The invention concerns the novel protein conductin that is able to regulate the .beta.-catenin function and interacts with the tumor suppressor adenomatous polyposis coli (APC); and its application in the gene therapy of colon cancer. The 840 amino acid contg. protein contains domains with various activities: 78-200 is the RGS (Regulator of G-Protein Signalling) binding sequence; 343-396 is the GSK 3.beta. (glycogen synthase kinase 3.beta.) binding sequence; 397-465 is the .beta.-catenin binding sequence; 783-833 is the Dishevelled homol. region. Mutations, variants and fragments of conductin with the corresponding coding genes and mRNA sequences are also included. Antibodies and

nucleic acid probes for the detection of c nductin are part of the diagnosis tools. For therapeutic purposes a vector contg. the conductin gene is constructed; substances that activate and reactivate conductin in the body are co-administered, e.g. a substance that activates the c nductin promoter or stabilizes mRNA. The effect of conductin was proved using SW480 cells with APC mutation and thus increased .beta.-catenin level. Introduction of conductin resulted in the decrease of .beta.-catenin to the same concn. as in non APC mutated SW480 cells. In an expt. with Xenopus embryos it was shown that conductin inhibits the Wnt/Wingless signaling pathway via its interaction with .beta.-catenin.

Conduction or Axil, an Axin homolog, plays an important role in the regulation of .beta.-catenin stability in the Wnt signaling pathway. To facilitate the mol. anal. of the human gene, we isolated the human homolog, AXIN2. The cDNA contains a 2529-bp open reading frame and encodes a putative protein of 843 amino acids. Compared with rat and mouse homologs, AXIN2 shows an overall 89% amino acid identity. Several functional domains in this protein are highly conserved including the GRS (95.9%), GSK-3.beta. (96.3%), Dsh (98%), and .beta.-catenin (89.9%) domains. Radiation hybrid mapping localized the AXIN2 gene to human chromosome 17q23-q24, a region that shows frequent loss of heterozygosity in breast cancer, neuroblastoma, and other tumors. Human AXIN2 is thus a very strong candidate involved in multiple tumor types. (c) 1999 Academic Press.

We report the identification and genomic structure of APC homologs. Mammalian APC2, which closely resembles APC in overall domain structure, was functionally analyzed and shown to contain 2 SAMP domains, both of which are required for binding to conductin

Like APC, APC2 regulates the formation of active .beta.-catenin-Tcf complexes, as demonstrated using transient transcriptional activation assays in APC-/- colon carcinoma cells. Human APC2 maps to chromosome 19p13.3. APC and APC2 may therefore have comparable functions in development and cancer.

AB Control of stability of .beta.-catenin is central in the wnt signaling pathway. Here, the protein conductin was found to form a complex with both .beta.-catenin and the tumor suppressor gene product adenomatous polyposis coli (APC). Conductin induced .beta.-catenin degrdn., whereas mutants of conductin that were deficient in complex formation stabilized .beta.-catenin. Fragments of APC that contained a conductin-binding domain also blocked .beta.-catenin degrdn. Thus, conductin is a component of the multiprotein complex that directs .beta.-catenin to degrdn. and is located downstream of APC. In Xenopus embryos, conductin interfered with wnt-induced axis formation.

NOVELTY - An agent (I) for therapy of human disorders, comprising an inhibitor of the binding of beta -catenin to LEF-1/TCF-transcription factors, APC (undefined) or conductin, is new.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for identifying agents (I), comprising identifying hydrophobic pockets in the vicinity of essential binding sites in the beta -catenin molecule, and synthesizing compounds which fit in these pockets.

ACTIVITY - Cytostatic.

No biological data is given.

MECHANISM OF ACTION - Inhibition of binding of beta -catenin to LEF-1/TCF-transcription factors, APC or conductin.

USE - For therapy of tumors (e.g. colon carcinoma or melanoma), for tissue regeneration or for stimulation of hair growth (claimed).

AN 2000-293152 [25] WPIDS

AB WO 200018913 A UPAB: 20000524

NOVELTY - Isolated and/or recombinant nucleic acid (NA) or a specific fragment, homolog or derivative thereof (I), corresponding to a gene located at position 19p13.3 in humans and comprising the 2397 base pair (bp) sequence given in the specification (adenomatous polyposis coli (APC)-2), is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

an expression vector comprising (I);

- (2) a cell comprising (I) or the expression vector of (1);
- (3) an animal comprising the cell of (2);
- (4) a protein, derivative, or fragment encoded by (I) or produced by the cell of (2);
  - (5) an antibody directed against the protein of (4);
- (6) identifying a candidate drug (especially a drug for use in a cancer patient), by using of the cell of (2), animal of (3), protein of (4), or antibody of (5); and
- (7) diagnosing cancer by using (I), the cell of (2), animal of (3), protein of (4), or antibody of (5).

ACTIVITY - Cytostatic.

MECHANISM OF ACTION - The adenomatous polyposis coli (APC) -2 tumor suppressor gene controls the Wnt pathway by the formation of a complex with GSK-3b, axin/conductin and beta -catenin, inducing the rapid degradation of the latter.

USE - The adenomatous polyposis coli (APC) - 2 polynucleotides are used for the diagnosis (claimed), prevention and treatment of cancer. They are also used for the recombinant production of APC-2 proteins. The methods are used to identify candidate drugs (claimed), especially for use in the treatment of cancers, preferably a fetal cancer, cancers with a stem cell phenotype, brain, lung, kidney or intestinal cancer (all claimed).

ADVANTAGE - None given.

DESCRIPTION OF DRAWING(S) - The figure shows the comparison of adenomatous polyposis coli (APC) and APC-2. Domain structures conserved between these APC relatives are indicated in various boxes.

\*ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS\*

Glycogen synthase kinase 3 beta (GSK3 beta) is a key component in AB many biological processes including insulin and Wnt signaling. Since the activation of each signaling pathway results in a decrease in GSK3 beta activity, we examined the specificity of their downstream effects in the same cell type. Insulin induces an increased activity of glycogen synthase but has no influence on the protein level of beta -catenin. In contrast, Wnt increases the cytosolic pool of beta -catenin but not glycogen synthase activity. We found that, unlike insulin, neither the phosphorylation status of the serine9 residue of GSK3 beta nor the activity of protein kinase B is regulated by Wnt. Although the decrease in GSK3 beta activity is required, GSK3 beta may not be the limiting component for Wnt signaling in the cells that we examined. Our results suggest that the axinconductin complexed GSK3 beta may be dedicated to Wnt rather than insulin signaling. Insulin and Wnt pathways regulate GSK3 beta through different mechanisms, and therefore lead to distinct downstream events.

AB Interactions between beta-catenin and LEF-1/TCF, APC and conductin/axin are essential for wnt-controlled stabilization of beta-catenin and transcriptional activation. The wnt signal transduction pathway is important in both embryonic development and tumor progression. We identify here amino acid residues in beta-catenin that distinctly affect its binding to LEF-1/TCF, APC and conductin. These residues form separate surface clusters, termed hot spots, along the armadillo superhelix

of beta-catenin. We also show that complementary charged and hydrophobic amino acids are required for formation of the bipartite beta-catenin-LEF-1 transcription factor. Moreover, we demonstrate that conductin/axin binding to beta-catenin is essential for beta-catenin degradation, and that APC acts as a cofactor of conductin/axin in this process. Binding of APC to conductin/axin activates the latter and occurs between their SAMP and RGS domains, respectively.

AB The wnt signal transduction pathway is involved in many differentiation events during embryonic development and can lead to tumor formation after aberrant activation of its components. The cytoplasmic component beta-catenin is central to the transmission of wnt signals to the nucleus: in the absence of wnts beta-catenin is constitutively degraded in proteasomes, whereas in the presence of wnts beta-catenin is stabilized and associates with HMG box transcription factors of the LEF/TCF family. In tumors, beta-catenin degradation is blocked by mutations of the tumor suppressor gene APC (adenomatous polyposis coli), or of beta-catenin itself. As a consequence, constitutive TCF/beta-catenin complexes are formed and activate oncogenic target genes. This review discusses the mechanisms that silence the pathway in cells that do not receive a wnt signal and goes on to describe the regulatory steps involved in the activation of the pathway.

The wnt signal transduction pathway is involved in various AB differentiation events during embryonic development and leads to tumor formation when aberrantly activated. The wnt signal is transmitted to the nucleus by the cytoplasmic component beta-catenin: in the absence of wnts, beta-catenin is constitutively degraded in proteasomes, whereas in the presence of wnts beta-catenin is stabilized and can associate with HMG box transcription factors of the LEF/TCF family. The LEF/TCF/beta-catenin complexes activate specific wnt target genes. In tumors, beta-catenin degradation is blocked by mutations of beta-catenin or of the tumor suppressor gene product APC. As a consequence, beta-catenin is stabilized, constitutive complexes with LEF/TCF factors are formed, and oncogenic target genes, such as c-myc, cyclin D1, and c-jun, are activated. Thus, control of beta-catenin is a major regulatory event in normal wnt signaling and during tumor formation. It has been found that a multiprotein complex assembled by the cytoplasmic component conductin induces degradation of cytoplasmic beta-catenin. The complex includes APC, the serine/threonine kinase GSK3 beta, and beta-catenin, which bind to conductin at distinct domains. In colon carcinoma cells, forced expression of conductin downregulates beta-catenin, whereas in normal cells mutants of conductin that are deficient in complex formation stabilize beta-catenin. Fragments of APC that contain a conductin-binding domain also block beta-catenin degradation. In Xenopus embryos, conductin inhibits the wnt pathway. In situ hybridization analysis shows that conductin is expressed in various embryonal tissues known to be regulated by wnts, such as the developing brain, mesenchyme below the epidermis, lung mesenchyme, and kidney. It is suggested that conductin controls wnt signaling by assembling the essential components of the beta-catenin degradation pathway. Alterations of

#### conductin function may lead to tumor formation.

Wingless/Wnt signaling directs cell-fate choices during embryonic AB development. In Drosophila, Wingless signaling mediates endoderm induction and the establishment of segment polarity in the developing embryo. The fly Wingless cascade is strikingly similar to the vertebrate Wnt signaling pathway, which controls a number of key developmental decisions such as dorsal-ventral patterning in Xenopus. Factors of the TCF/LEF HMG domain family (Tcfs) have recently been established as the downstream effectors of the Wingless/Wnt signal transduction pathways. Upon Wingless/Wnt signaling, a cascade is initiated that results in the accumulation of cytoplasmic beta-catenin (or its fly homolog, Armadillo). There is also a concomitant translocation of beta-catenin/Armadillo to the nucleus, where it interacts with a specific sequence motif at the  ${\tt N}$ terminus of Tcfs to generate a transcriptionally active complex. This bipartite transcription factor is targeted to the upstream regulatory regions of Tcf target genes including Siamois and Nodal related gene-3 in Xenopus, engrailed and Ultrabithorax in Drosophila via the sequence-specific HMG box, and mediates their transcriptional activation by virtue of transactivation domains contributed by beta-catenin/Armadillo. In the absence of Wingless/Wnt signals, a key negative regulator of the pathway, GSK3 beta, is activated, which mediates the downregulation of cytoplasmic beta-catenin/Armadillo via the ubiquitin-proteasome pathway. In the absence of nuclear beta-catenin, the Tcfs recruit the corepressor protein Groucho to the target gene enhancers and actively repress their transcription. An additional corepressor protein, CREB-binding

protein (CBP), may also be involved in this repression of Tcf target gene activity. Several other proteins, including adenomatous polyposis coli (APC), GSK3 beta, and Axin/Conductin, are instrumental in the regulation of beta-catenin/Armadillo. In APC-deficient colon carcinoma cell lines, beta-catenin accumulates and is constitutively complexed with nuclear Tcf-4. A proportion of APC wild-type colon carcinomas and melanomas also contains constitutive nuclear Tcf-4/beta-catenin complexes as a result of dominant mutations in the N terminus of beta-catenin that render it insensitive to downregulation by APC, GSK3 beta, and Axin/ C nductin. This results in the unregulated expression of Tcf-4 target genes such as c-myc. Based on the established role for Tcf-4 in maintaining intestinal stem cells it is likely that deregulation of c-myc expression as a result of constitutive Tcf-4/beta-catenin activity promotes uncontrolled intestinal cell proliferation. This would readily explain the formation of intestinal polyps during colon carcinogenesis. Similar mechanisms leading to deregulation of Tcf target gene activity are likely to be involved in melanoma and other forms of cancer

AB DE 19909251 A UPAB: 19991004

NOVELTY - Agent (A) for treating human disease is based on substances (I) that modulate (inhibit or promote) the interaction of beta -catenin (bC) with transcription factors or products of tumor suppressor genes.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following: (a) peptide (II) comprising part of the LEF-1/TCF-4 transcription factors, or their variants and mutants; (b) peptide and related molecules (III) from the armadillo domain (arm units 3-8) of bC, and mutants of the complete bC molecule, that include at least one of the specific interaction domains for LEF-1, TCF-4, APC, conductin or E-cadherin; and (c) enzyme-linked immunosorbent assay (ELISA) for screening substance libraries for compounds that modulate interaction of bC with LEF-1/TCF, APC, conductin or E-cadherin.

ACTIVITY - Antitumor.

MECHANISM OF ACTION - bC is a key compound in the Wnt signaling pathway and is involved in development of tumors.

Generally its interaction with LEF-1 or TCF-4 is oncogenic but interaction with APC, conductin or E-cadherin is anti-oncogenic.

USE - (A) which inhibit interaction are particularly used to treat tumors, especially carcinoma of the colon and melanoma, but also, where they promote interaction, to stimulate regeneration of organs and tissues, specifically hair growth. Dwg.0/6

Since its discovery as a protein associated with the cytoplasmic AB region of E-cadherin, beta-catenin has been shown to perform two apparently unrelated functions: it has a crucial role in cell-cell adhesion in addition to a signaling role as a component of the Wnt/wg pathway. Wnt/wg signaling results in beta-catenin accumulation and transcriptional activation of specific target genes during development. It is now apparent that deregulation of beta-catenin signaling is an important event in the genesis of a number of malignancies, such as colon cancer, melanoma, hepatocellular carcinoma, ovarian cancer. endometrial cancer, medulloblastoma pilomatricomas, and prostate cancer. beta-catenin mutations appear to be a crucial step in the progression of a subset of these cancers , suggesting an important role in the control of cellular proliferation or cell death. The APC/beta-catenin pathway is highly regulated and includes players such as GSK3-beta, CBP, Groucho, Axin, Conductin, and TCF. c-MYC and cyclin D1 were recently identified as a key transcriptional targets of this pathway

Beta-catenin plays a structural role in cell adhesion by binding to AB cadherins at the intracellular surface of the plasma membrane and a signaling role in the cytoplasm as the penultimate downstream mediator of the wnt signaling pathway. The ultimate mediator of this pathway is a nuclear complex of beta-catenin acting as a coactivtor with lymphoid enhancer factor/T cell factor (Lef/Tcf) transcription factors to stimulate transcription of a variety of target genes. Signaling through beta-catenin is regulated by modulating its degradation and nuclear translocation. In the absence of an activating signal, phosphorylation of beta-catenin by glycogen synthase kinase 3 (GSK3) acting in conjunction with adenomatous polyposis coli and axin/conductin causes beta-catenin to interact with the beta-transducin repeat-containing protein which results in its ubiquitination and degradation. Signaling from the wnt pathway activates dishevelled which, in an as yet undefined manner, inhibits the activity of GSK3 resulting in an increase in the cytoplasmic free pool of beta-catenin, and translocation into the nucleus. The integrin-linked kinase (ILK) pathway also activates beta-catenin-Lef/Tcf signaling. ILK phosphorylates GSK3 to inhibit its activity and translocates beta-catenin into the nucleus. In addition, ILK downregulates the expression of E-cadherin and upregulates Lef-1 expression. In the final step of the beta-catenin-Lef/Tcf signaling pathway, nuclear beta-catenin binds pontin52-TATA binding protein and displaces Groucho-related gene or

CREB-binding protein corepressors from Lef/Tcf resulting in stimulation of transcription. During development, beta-catenin-Lef/Tcf signaling is involved in the formation of dorsal mesoderm and dorsal axis. Furthermore, defects in the beta-catenin-Lef/Tcf pathway are involved in the development of several types of cancers.

BACKGROUND: Mutations in the adenomatous polyposis coli (APC) AB tumour suppressor gene are implicated in the genesis of colorectal cancers. The product of the APC gene forms a complex with beta-catenin, glycogen synthase kinase 3beta (GSK-3beta) and Axin/conductin, and induces the degradation of beta-catenin. RESULTS: We have identified a novel Drosophila homologue of APC, E-APC, which is similar to but differs in several respects from D-APC. The E-APC cDNA encodes a protein of predicted 1067 amino acids, with seven armadillo repeats, two copies of the 15-amino acid repeat, five copies of the 20-amino acid repeat, and one Axin/conductin binding site. E-APC directly interacts with D-Axin and Armadillo (Arm, the Drosophila homologue of beta-catenin) in vitro, destabilizes intracellular beta-catenin, and suppresses beta-catenin/TCF-regulated transcription in APC-/- colon cancer cells. The E-APC mRNA is ubiquitously expressed throughout all developmental stages in Drosophila. CONCLUSION: Our findings suggest that E-APC may be universally involved in the regulation of the Wingless signalling pathway by down-regulating the level of Arm in Drosophila.

Conductin or Axil, an Axin homolog, plays an important AB role in the regulation of beta-catenin stability in the Wnt signaling pathway. To facilitate the molecular analysis of the human gene, we isolated the human homolog, AXIN2. The cDNA contains a 2529-bp open reading frame and encodes a putative protein of 843 amino acids. Compared with rat and mouse homologs, AXIN2 shows an overall 89% amino acid identity. Several functional domains in this protein are highly conserved including the GRS (95.9%), GSK-3beta (96.3%), Dsh (98%), and beta-catenin (89.9%) domains. Radiation hybrid mapping localized the AXIN2 gene to human chromosome 17q23-q24, a region that shows frequent loss of heterozygosity in breast cancer, neuroblastoma, and other tumors. Human AXIN2 is thus a very strong candidate involved in multiple tumor types.

\*ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS\* AΒ The Wnt signaling pathway is conserved in various species from worms to mammals, and, plays important roles in development, cellular proliferation, and differentiation. The molecular mechanisms by which the Wnt signal regulates cellular functions are becoming increasingly well understood. Wnt stabilizes cytoplasmic beta-catenin, which stimulates the expression of genes including c-myc, c-jun, fra-1, and cyclin D1. Axin and its homolog Axil, newly recognized as components of the Wnt signaling pathway, negatively regulate this pathway. Other components of the Wnt signaling pathway, including DvI, glycogen synthase kinase-3 beta (GSK-3). beta), beta-catenin, and adenomatous polyposis coli (APC), interact with Axin, and the phosphorylation and stability of beta-catenin are regulated in the Axin complex. Axil has similar functions to Axin. Thus, Axin and Axil act as scaffold proteins in the Wnt signaling pathway, thereby modulating the Wnt-dependent cellular functions. (C) 2000 Elsevier Science Ltd. The adenomatous polyposis coli (APC) tumour-suppressor protein controls the Wnt signalling pathway by forming a complex with glycogen synthase kinase 3beta (GSK-3beta), axin/ conductin and betacatenin. Complex formation induces the rapid degradation of betacatenin. In colon carcinoma cells, loss of APC leads to the accumulation of betacatenin in the nucleus, where it binds to and activates the Tcf-4 transcription factor (reviewed in [1] [2]). Here, we report the identification and genomic structure of APC homologues. Mammalian APC2, which closely resembles APC in overall domain structure, was functionally analyzed and shown to contain two SAMP domains, both of which are required for binding to conductin. Like APC, APC2 regulates the formation of active betacatenin-Tcf complexes, as demonstrated using transient transcriptional activation assays in APC -/- colon carcinoma cells. Human APC2 maps to chromosome 19p13.3. APC and APC2 may therefore have comparable functions in development and cancer.

STATUS:

New

In excising a ganglion located at the dorsum of the wrist joint, one AB may lose sight of the base of the ganglion, which may result in a recurrence of the condition; or the surgical procedure may leave a large, unsightly surgical cicatrix on the dorsum of the hand due to the size of the lesion. To eliminate these problems, we have been conductin surgery on ganglions of the dorsal wrist joint under arthroscopy. The details are reported below. A total of 16 joints(10 right and 6 left) in 16 patients(7 males and 9 females, ages ranging from 12 to 83 years, with a mean of 42 years) have undergone the arthroscopic procedure. A nodule was palpated at the center of the dorsum of the wrist in each patients and all reported pain that was associated with movement. Six had experienced repeated recurrences for six months or more; the condition had developed for the first time in eight (among whom, two had been subjected to repeated aspiration therapy); and the condition had returned in one following surgical therapy. MRI was conducted prior to surgery to confirm that there was communication between the ganglion and the

scapholunate joint(SL joint). Arthroscopy was conducted at portals I-II and a probe and a shaver were inserted through portals IV-V. The position of the base of the ganglion that was palpated at the dorsum of the scapholunate ligament(SL ligament) was confirmed under arthroscopy and excised with the shaver. No recurrence was noted and the postoperative course was satisfactory for a follow-up period that lasted from 2 to 15 months (mean, 6.4). The method introduced above applies to all ganglions that originate at the SL joint: but it is particularly suitable for large growths that are likely to leave prominent surgical scars or for radical treatment of those that return repeatedly after aspiration and cause pain associated with wrist movement. Control of stability of beta-catenin is central in the wnt signaling AB pathway. Here, the protein conductin was found to form a

complex with both beta-catenin and the tumor suppressor gene product adenomatous polyposis coli (APC). Conductin induced beta-catenin degradation, whereas mutants of

conductin that were deficient in complex formation

stabilized beta-catenin. Fragments of APC that contained a

conductin-binding domain also blocked beta-catenin degradation. Thus, conductin is a component of the

multiprotein complex that directs beta-catenin to degradation and is located downstream of APC. In Xenopus embryos, conductin

interfered with wnt-induced axis formation.

P-glycoprotein (pgp) is a membrane transport protein that causes multidrug resistance (MDR) by actively extruding a wide variety of cytotoxic agents out of cells. In may also function as a peptide transporter, a vol.-regulated chloride channel, and an ATP channel. Previously, it has been shown that hamster pgp1 Pgp is expressed in more than one topol. form and that the generation of these structures is modulated by charged amino acids flanking the predicted transmembrane (TM) segments 3 and 4 and by sol. cytoplasmic factors. Different topol. structures of Pgp may be related to its different functions. This study examd. the effects of translation temp. on the membrane insertion process and the topologies of Pgp. The rabbit reticulocyte lysate expression system was used to show that translation at different temps. affects the membrane insertion and orientation of the putative TM3 and TM4 of hamster pgpl Pgp in a co-translational manner. This observation suggests that the membrane insertion process of TM3 and TM4 of Pgp mols. may involve a protein conducting channel and/or the interaction between TM3 and TM4, which act in a temp. sensitive manner. Manipulating temp. may provide a way to understand the structure-function relationship of Pgp and help overcome Pgp-related multidrug resistance of cancer cells.

I,  $R=CHMe_2$ , Z=H, n=1

II, R=Me, Z=H, n=1

III, R=Me, Z=COCH2CO, n=2

AB A series of brusatol, bisbrusatol, and bruceantin esters were examd. for their ability to inhibit protein synthesis in P-388 lymphocytic leukemia cells. Compds. which produced high antileukemic activities resulted in ID50 of 5.4-15.5 .mu.M for inhibition of whole cell protein synthesis, ID50 of 1.3-13 .mu.M for inhibition of endogenous protein synthesis in cell homogenates, and ID50 of 1.9-6 .mu.M for inhibition of polyuridine directed polyphenylalanine synthesis using runoff ribosomes and a pH 5 enzyme prepn. The polyuridine directed polyphenylalanine synthesis requires neither initiation nor termination factors, suggesting that quassinoids are exclusively elongation inhibitors. bruceantin (I) [41451-75-6], brusatol (II) [14907-98-3], and bisbrusatolyl malonate (III) [80096-78-2] allowed a runoff of the polyribosomes to 80-S free ribosomes. However, formation of the ternary complex and 80-S initiation complex were not inhibited by the quassinoids. Thus, these agents do not affect the individual steps leading to the formation of a stable 80-S initiation complex in P-388 cells. Brusatol, bruceantin, and bisbrusatolyl malonate inhibited the formation of the first peptide bond between puromycin and [3H] methionyl-transfer RNA bound to the initiation complex, indicating peptidyl transferase activity is inhibited by the quassinoids in P-388 cells. Apparently, the free 80-S ribosome is the site of binding by the quassinoid. Ribosomes actively conducting protein synthesis will continue protein synthesis and terminate before the quassinoids bind. Thus, quassinoids are elongation inhibitors of tumor cells. A strong correlation was obsd. between potent antileukemic activity and the ability to inhibit protein synthesis in P-388 lymphocytic leukemia cells.

The electronic structure of carcinogen-protein mol. complexes was examd. theoretically and the possibility of charge transfer in the complex discussed. A banded-electronic model of a protein suggests that electron transfer within such a mol. complex will take place only when the energy levels of the mols. of the complex are closely matched. Aromatic carcinogens satisfy a precise criterion for such matching of levels, and carcinogenesis is to be assocd. with the induction of conducting properties in the protein.

AN 2001-266373 [27] WPIDS

AB WO 200125794 A UPAB: 20010518

NOVELTY - A new method (M1) for detecting proteins having at least two different types of residues comprises giving a detectable set of distinguishing ancillary properties (a 'fingerprint') to the proteins and then detecting the fingerprint by linearizing the protein, labeling the first type of residue and detecting first and second amino acid residues.

DETAILED DESCRIPTION - A new method (M1) for detecting proteins having at least two different types of residues comprises giving a detectable set of distinguishing ancillary properties (a 'fingerprint') to the proteins and then detecting the fingerprint by linearizing the protein, labeling the first type of residue and detecting first and second amino acid residues.

In detail, M1 comprises:

- (a) linearizing the protein molecule with a denaturation means;
- (b) labeling each of the first type of amino acid residue with a tag;
- (c) detecting the fingerprint of the protein with a detection means, by detecting a first fingerprint constituent imparted by the tag and a second fingerprint constituent imparted by the second type of amino acid residue.

INDEPENDENT CLAIMS are also included for the following:

- (1) identifying a protein molecule having at least two different amino acid residue types in a sample containing several proteins, by linearizing each protein as in M1 step (a), isolating the **protein**, **conducting** steps (b) and (c) of M1, and comparing the fingerprint obtained (optionally using a computer receiving signals from the detection means) to a library of fingerprints of known protein molecules;
- (2) a library of fingerprint values of known proteins, listing the identity of the proteins and first and second (and optionally third) fingerprint constituents of each protein, being representative of the number and sequence of the first and second

(and optionally third) types of amino acid residues respectively;

- (3) characterizing protein molecules, by isolating the protein and using M1 which is modified such that first and second types of amino acid types are both labeled with different tags;
- (4) protein molecules having an identifiable fingerprint, comprising two amino acid residue types each separately tagged, or three amino acid types (optionally including tryptophan), imparting up to six fingerprint constituents by using combinations of excitation and emitted radiations; and
- (5) identifying a protein in a sample containing several proteins, following the method of (1) which is modified such that first and second residue types are both labeled with different tags.

USE - The method is useful to enable rapid identification of protein molecules, especially in biological samples e.g. plant, microorganism or animal (especially human) tissues or cells e.g. in clinical or research applications to identify aberrant or mutant forms of proteins involved in diseases such as cancers or inherited disorders such as cystic fibrosis and hemophilia. It also enables the production of a library of known proteins and their corresponding fingerprints, useful to identify unknown proteins in a sample.

AN 2001-050022 [06] WPIDS

AB WO 200075188 A UPAB: 20010126

NOVELTY - Translocation of a protein of interest from an intracellular location to the plasma membrane in mammalian cells, when the cells are exposed to a condition or a stimulus, is assessed by using a modified protein of interest (MP) comprising the protein of interest and an epitope tag in an extracellular domain and a fluorescent tag in an intracellular domain.

DETAILED DESCRIPTION - Translocation of a protein of interest from an intracellular location to the plasma membrane in mammalian cells, when the cells are exposed to a condition or a stimulus, is assessed by using a modified protein of interest (MP) comprising the protein of interest and an epitope tag in an extracellular domain and a fluorescent tag in an intracellular domain.

The method (I) comprises:

- (a) culturing mammalian cells (test cells) expressing MP, under a condition or a stimulus to be assessed for its effects on translocation of the protein of interest;
- (b) determining a value corresponding to proportion of MP at the cell membrane to total MP in the test cells that produces a test value; and
- (c) comparing the test value with a control value, where the control value corresponds to the proportion of MP at the cell membrane to MP in control cells, where the control cells are the same cells as are cultured in (a), except that the control cells are not cultured under the condition or stimulus to be assessed, where the test value greater than the control value indicates that translocation of MP has occurred.

INDEPENDENT CLAIMS are also included for the following:

(1) determining (II) whether a protein of interest undergoes

translocation from an intracellular location to the plasma membrane in mammalian cells in the presence of a condition or stimulator, comprising:

- (a) culturing cells that express MP in the absence of the stimulator producing cultured cells;
- (b) determining the relative proportion of MP at the plasma membrane of cultured cells to total MP in the cultured cells, by producing a control value;
- (c) culturing cells that express MP under the same conditions as in (a) and in the presence of the stimulator, by producing test cells;
- (d) determining the relative proportion of MP at the plasma membrane of test cells to total MP in the test cells, by producing a test value; and
- (e) comparing the control value and the test value, where a test value that is greater than the control value indicates that protein of interest undergoes translocation following stimulation of the cells by the stimulator;
- (2) identifying (III) a drug which enhances translocation of a protein of interest from an intracellular location to the plasma membrane in mammalian cells by:
- (a) culturing cells which express RT in the presence of a candidate drug;
- (b) determining the relative proportion of MP at the plasma membrane of cultured cells to total MP in the cultured cells, producing a test value; and
- (c) comparing the test value with the control value, which is the relative proportion of the protein of interest at the plasma membrane to MP in cells cultured under same conditions in the absence of drug, where the test value greater than the control value indicates that the candidate drug enhances translocation of the protein of interest; and
- (3) eukaryotic cells (IV) expressing MP comprising a protein of interest and a detectable tag in an extracellular domain and at least 1 detectable tag in an intracellular domain, where the tags are different from each other and the protein of interest undergoes translocation in the eukaryotic cells upon contact with or exposure to a condition.
- USE The method is useful for determining translocation of a protein of interest such as aquaporin-2, cystic fibrosis transmembrane conductance regulator, gastric H+/K+ATPase, in particular GLUT4 from an intracellular location to the plasma membrane in mammalian cells in the presence of a condition or a stimulator. (III) is useful for assessing the effect of a drug on translocation of a protein such as GLUT4. Such drugs are useful in treating insulin resistance such as in adult-onset diabetes, obesity and polycystic ovary syndrome.

ADVANTAGE - Translocation of the protein of interest can be

# 09/587574

easily assessed using the tags. The tags can be detected individually, quantified and the addition of tags does not alter trafficking of the protein of interest. Dwg.0/7

WO 9947557 A UPAB: 19991122

NOVELTY - Isolated RGS-guanine nucleotide exchange factor (GEF) polypeptides are new.

DETAILED DESCRIPTION - A novel isolated RGS-GEF polypeptide or a biologically active fragment consists of an RGS domain of a GEF protein.

INDEPENDENT CLAIMS are also included for the following:

- (1) an isolated RGS-GEF polypeptide or a biologically active fragment comprising an RGS domain of a GEF protein, with the proviso that the polypeptide does not comprise a dbl homology (DH) domain or a pleckstrin homology (PH) domain;
- (2) an isolated RGS-GEF polypeptide, or a biologically active fragment, where the polypeptide is selected from p115 Rho-GEF, Lsc, KIAA380, and where the polypeptide is mutated in the RGS domain, and where the polypeptide has a specific binding affinity for a G protein alpha subunit (GAS), or a GTPase activating activity for a GAS;
- (3) an isolated RGS-GEF nucleic acid consisting of a nucleotide sequence (NS) encoding a polypeptide comprising an RGS domain of a GEF protein;
- (4) a nucleic acid as in (3) but, where the polypeptide does not include a DH domain or a PH domain;
  - (5) a transformed cell containing a nucleic acid as in (4);
  - (6) a vector comprising a nucleic acid as in (4), and
  - (7) identifying or assaying a molecule that:
- (a) inhibits or enhances binding of a monomeric G protein guanine nucleotide exchange factor to a GAS comprising:
- (i) incubating the GAS, or fragments with the monomeric G protein nucleotide exchange factor, or fragments, in the presence and absence of a test molecule, and
- (ii) determining whether the presence of the test molecule inhibits or enhances binding between the monomeric G-protein guanine nucleotide exchange factor and the GAS;
- (b) inhibits or enhances a stimulatory effect of a GEF on a GAS GTPase activity comprising:
  - (i) as in (ai), and
- (ii) determining whether the presence of the test molecule inhibits or enhances the stimulatory effect of the GEF protein on GAS GTPase activity;
- (c) specifically inhibits the stimulatory effect of an activated GAS on GEF mediated nucleotide exchange of a monomeric G protein, comprising conducting a first assay by:
- (i) incubating an activated GAS, or its fragments, with a GEF protein, or fragments, and a monomeric G protein, or its fragments, in the presence and absence of a test inhibitor;
- (ii) conducting a second assay by incubating a GEF protein, or fragments, and a monomeric G protein. or fragments in the presence

and absence of the test inhibitor, and

- (iii) determining whether any inhibitory effect of the test inhibitor in the first assay is greater than any inhibitory effect of the test inhibitor in the second assay;
- (d) specifically enhances the stimulatory effect of an activated GAS on GEF mediated nucleotide exchange of a monomeric G protein, comprising:
- (i) conducting a first assay by incubating an activated GAS, or fragments with a GEF protein. and fragments, and a monomeric G protein, or fragments in the presence and absence of a test enhancer;
- (ii) as in (cii), but in the presence/absence of the test enhancer, and
- (iii) determining whether any enhancing effect of the test enhancer in the first assay is greater than any enhancing effect of the test enhancer in the second assay;
- (e) mimics the stimulatory effect of an activated GAS on GEF mediated nucleotide exchange of a monomeric G protein comprising:
- (i) identifying a test compound that exhibits a binding affinity for the RGS domain of GEF proteins, or fragments, incubating a GEF protein or fragments, and monomeric G protein, or fragments in the presence or absence of the test compound, and
- (ii) determining whether the test compound exhibits a stimulatory effect on GEF mediated nucleotide exchange of a monomeric G protein, and
- (f) mimics the stimulatory effect of an RGS domain of a GEF protein on GTPase activity of a GAS comprising:
- (i) identifying a test compound that exhibits a binding affinity for a GAS, and
- (ii) incubating a GTP loaded GAS in the presence or absence of the test compound to determine whether the test compound has a stimulatory effect on GAS GTPase activity.
- USE The RGS-GEF polypeptides can be used for modulating an activity of a GAS (claimed). The products can be used for the regulation of biological pathways in which a RGS-GEF polypeptide is involved, particularly pathological conditions, e.g. cell proliferation (e.g. cancer), growth control, morphogenesis, stress fiber formation, and integrin-mediated interactions, such as embryonic development, tumor cell growth and metastasis, programmed cell death, hemostasis, leukocyte homing and activation, bone resorption, clot retraction, and the response of cells to mechanical stress. The products can also be used for detection, diagnosis and production of transgenic animals.

ADVANTAGE - None given. Dwg.0/18

AB We report here the isolation of a new member of the ADP-ribosylation factor (ARF)-like family (ARL-6) present in the J2E erythroleukemic cell line, but not its myeloid variants. Consistent with this lineage-restricted expression, ARL-6 mRNA increased with

erythropoietin-induced maturation of J2E cells, and decreased with interleukin 6-induced differentiation of M1 monoblastoid cells. In tissues, ARL-6 mRNA was most abundant in brain and kidney. While ARL-6 protein was predominantly cytosolic, its membrane association increased following exposure to GTP-gammaS, like many members of the ARF/ARL family. Using the yeast two-hybrid system, six molecules which interact with ARL-6 were identified including SEC61beta, a subunit of the heterotrimeric protein conducting

channel SEC61p. Co-immunoprecipitation of ARL-6 confirmed a stable association between ARL-6 and SEC61beta in COS cells. These results demonstrate that ARL-6, a novel member of the ADP-ribosylation factor-like family, interacts with the SEC61beta subunit.

1997-183797 JAPIO AN

PURPOSE: TO BE SOLVED: To obtain a new protein having activated AB

Rho-protein binding ability, inhibiting Rho-protein GTPase activity,

thus capable of inhibiting tumor development and

metastasis through neutralizing Rho-protein involving tumor

development and metastasis.

CONSTITUTION: protein is a new physiologically active protein Rhotekin (or its modified product), which has activated Rho-protein binding ability and inhibits Rho-protein GTPase activity, containing part or the whole of an amino acid sequence of the formula, or an equivalent sequence thereto. This protein is capable of neutralizing the Rho protein closely involving tumor development and metastasis, thus of inhibiting tumor development and metastasis. This new protein is obtained by conducting a library screening by yeast-two-hybrid system using mouse fetal cDNA library to isolate the gene of mouse's activated Rho- protein-binding protein followed by integrating a vector with the gene which is then manifested in host cells.

AB P-glycoprotein (pgp) is a membrane transport protein that causes multidrug resistance (MDR) by actively extruding a wide variety of cytotoxic agents out of cells. It may also function as a peptide transporter, a volume-regulated chloride channel, and an ATP channel. Previously, it has been shown that hamster pgp 1 Pgp is expressed in more than one topological form and that the generation of these structures is modulated by charged amino acids flanking the predicted transmembrane (TM) segments 3 and 4 and by soluble cytoplasmic factors. Different topological structures of Pgp may be related to its different functions. In this study, we examined the effects of translation temperature on the membrane insertion process and the topologies of Pgp. Using the rabbit reticulocyte lysate expression system, we showed that translation at different temperatures affects the membrane insertion and orientation of the putative TM3 and TM4 of hamster pgp 1 Pgp in a co-translational manner. This observation suggests that the membrane insertion process of TM3 and TM4 of Pgp molecules may involve a protein conducting channel and/or the interaction between TM3 and TM4, which act in a temperature sensitive manner. We speculate that manipulating temperature may provide a way to understand the structure-function relationship of Pop and help overcome Pgp-related multidrug resistance of cancer cells.

AB Neurons and glia are capable of both secreting and responding to a large variety of growth factors. However, information on multiple expression of growth factors and their receptors was usually obtained from uncorrelated observations, using cells from various

animals of origin, developmental stages, growth phases, culture ages and culture conditions. Because of its specificity and extreme sensitivity, reverse transcription-polymerase chain reaction (RT-PCR) is uniquely suitable to study a large panel of growth factors and their receptors from a limited cell sample, free of these intervening variables. In this paper we evaluate the expression of mRNA of a total of 35 growth factor-related proteins by conducting RT-PCR on three neuronal cell lines: the PC12 rat pheochromocytoma line, the MAH rat sympathoadrenal progenitor line, and the N18 mouse neuroblastoma line. Three types of results are presented. The first confirms the existing knowledge such as the presence of Trk-A (NFG receptor) in PC12. The second consists of new information that expands and extends earlier observations, such as the presence of CNTF receptor complex in PC12, which explains our previous report that CNTF enhances the biological effects of NGF on these cells. The third consists of novel information that leads the way to further experimentation by the more conventional methods. These include the strong expression of Trk-B by MAH, predicting the biological responsiveness of MAH to BDNF and NT-4, and the expression of CNTF receptor in N18. Our results also suggest that CNTF is an autocrine factor for PC12 and MAH, since both lines express the growth factor as well as the receptor. Thus, RT-PCR is a valuable tool in growth factor research that can be used in complement to, and interactively with, other approaches such as bioassay, receptor binding, and immunochemical determination. It will be particularly useful for screening a large number of growth factors in minute areas of the brain in patients suffering from neurodegenerative diseases such as Parkinson's and Alzheimer's.

AΒ A series of brusatol, bisbrusatol, and bruceantin esters were examined for their ability to inhibit protein synthesis in P-388 lymphocytic leukemia cells. Compounds which produced high T/C % values (170-272) resulted in ID50 of 5.4-15.5 microM for inhibition of whole cell protein synthesis, ID50 of 1.3-13 microM for inhibition of endogenous protein synthesis in cell homogenates, and ID50 of 1.9-6 microM for inhibition of polyuridine directed polyphenylalanine synthesis using "runoff" ribosomes and a "pH 5" enzyme preparation. The polyuridine directed polyphenylalanine synthesis requires neither initiation nor termination factors, suggesting that quassinoids are exclusively elongation inhibitors. Bruceantin, brusatol, and bisbrusatolyl malonate allowed a runoff of the polyribosomes to 80S free ribosomes. However, formation of the ternary complex and 80S initiation complex were not inhibited by the quassinoids. Thus, these agents do not affect the individual steps leading to the formation of a stable 80S initiation complex in P-388 cells. Brusatol, bruceantin, and bisbrusatolyl malonate inhibited the formation of the first peptide bond between puromycin and [3H] methionyl-transfer RNA bound to the initiation complex, indicating peptidyl transferase activity is inhibited by the quassinoids in P-388 cells. These studies also suggest that the free 80S ribosome is the site of binding by the quassinoid. Ribosomes actively conducting protein synthesis will continue protein synthesis and terminate before the quassinoids bind. This proves quassinoids are elongation inhibitors of tumor cells. A strong correlation was observed between

# 09/587574

potent antileukemic activity and the ability to inhibit protein synthesis in P-388 lymphocytic leukemia cells.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                                                                                                                                                                                                                                                                                                                         Human conductin protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel human conductin protein which has anti-tumour activity. Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tumor-suppressing protein conductin diagnosis of tumors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               198

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC Nucleic acids encoding mutant and wild type Axin and CC oligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is likely to develop cancer (including breast, colorectal, The wild gastrointestinal, esophageal, carcinomas or melanomas). The wild cype Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through negative regulation of the Wnt pathway in the Nieuwkoop Center.

The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for

Novel regulator of G-protein signaling useful as diagnostic and investigative signaling disorders nucleic acids and polypeptides, tools and to treat G-protein G-protein

Claim 8; Page 102; 105pp; English.

The RGS (regulators of G-protein signaling) protein genes, clones h16395 and m1975, were identified in human and murine spleen cDNA libraries, respectively. Both proteins have unique N- and C-terminal sequences. The C-terminal location of the RGS domain is consistent with RGSs known to act as GTPase activating proteins (GAPs) for G-alpha proteins. G-alpha-i linked receptors support rapid adhesion and directed migration of leukocytes and other cell types. The novel RGS proteins may be used to modulate cell adhesion and chemotaxis, e.g. for alding wound repair. The RGS proteins, related cDNAs and anti-RGS antibodies are useful for modulation, diagnosis and treatment of immune and respiratory disorders.

                                                                                                                                                                                                                                         The RGS (regulators of G-protein signaling) protein genes, clones h16395 and m1975, were identified in human and murine spleen cDNA libraries, respectively. Both proteins have unique N- and C-terminal sequences. The C-terminal location of the RGS domain is consistent with RGSs known to act as GTPase activating proteins (GAPs) for G-alpha proteins. G-alpha-1 linked receptors support rapid adhesion and directed migration of leukocytes and other cell types. The novel RGS proteins may be used to modulate cell adhesion and chemotaxis, e.g. for alding wound repair. The RGS proteins, related cDNAs and anti-RGS antibodies are useful for modulation, diagnosis and treatment of immune and respiratory disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to isolated RGS-guanine nucleotide exchange factor (GEF) polypeptides. The novel isolated RGS-GEF polypeptide consists of an RGS domain of a GEF protein and does not comprise a dbl homology (PH) domain or a pleckstrin homology (PH) domain. The RGS-GEF polypeptides can be used for modulating an activity of a G protein alpha subunit (GAS). The products can be used for the regulation of biological pathways in which a RGS-GEF polypeptide is involved, particularly pathological conditions, e.g. cell proliferation (e.g. cancer), morphogenesis, growth conditions, e.g. cell proliferation (e.g. cancer), morphogenesis, growth as embryonic development, tumor cell growth and metastasis, programmed cell death, hemostasis, leukocyte homing and activation, bone resorption, clot retraction, and the response of cells to mechanical stress. The products can also be used for detection, diagnosis and production of several

                                                                                                                                                                                                                                                                                                                         F15566 to F16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in B56363 to B57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer antigen polynucleotides may be chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, polynonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. F16506 to F16514 to B57303 represent sequences used in the exemplification of the present invention.

CC B4338 to B4239. The proteins can have activities based on the tissues CC and cells the genes are expressed in Example of activities include: CC cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; CC antiasthmatic; antiahematic; antiabeterial; antiviral; dermatological; CC antityroid; antiahlergic; antibacterial; antiviral; dermatological; CC neuroprotective; cardiant; thrombolytic; coagulant; nootropic; artipsoriatic and antianglogenic. The polynucleotides and CC vasotropic; antipsoriatic and antianglogenic. The polynucleotides and CC polypeptides can be used for preventing, treating or ameliorating medical CC conditions and diagnosing pathological conditions. Polynucleotides, CC polypeptides, antibodies, agonists and antagonists from the present CC invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune CC cells, to treat disorders of haematopoietic cells, autoimmune disorders, callergic reactions, syraft versus host disease and organ rejection, CC concers, cardiovascular disorders, neurological disease and bacterial or ciral infections. The peptides, nucleotides, antibodies, agonists and CC antagonists may be also be used in drug screens. C78449 to C78457 and CC invention.

                                                                                                                                                                                                                                                                                                                                                   (GEF) polypeptides. The novel isolated RGS-GEF polypeptide consists of an RGS domain of a GEF protein and does not comprise a dbl homology (DH) domain or a pleckstrin homology (PH) domain. The RGS-GEF polypeptides can be used for modulating an activity of a G protein alpha subunit (GAS). The products can be used for the regulation of biological pathways in which a RGS-GEF polypeptide is involved, particularly pathological conditions, e.g. cell proliferation (e.g. cancer), morphogenesis, growth control, stress fiber formation, and integrin-mediated interactions, such as embryonic development, tumor cell growth and metastasis, programmed cell death, hemostasis, leukocyte homing and activation, bone resorption, clot retraction, and the response of cells to mechanical stress. The

                                          RGS domain of a GEF protein and does not comprise a dbl homology (DH) domain or a pleckstrin homology (PH) domain. The RGS-GEF polypeptides can be used for modulating an activity of a G protein alpha subunit (GAS). The products can be used for the regulation of biological pathways in which a RGS-GEF polypeptide is involved, particularly pathological conditions, e.g. cell proliferation (e.g. cancer), morphogenesis, growth control, stress fiber formation, and integrin-mediated interactions, such as embryonic development, tumor cell growth and metastasis, programmed cell death, hemostasis, leukocyte homing and activation, bone resorption, clot retraction, and the response of cells to mechanical stress. The products can also be used for detection, diagnosis and production of several transgenic animals. Sequences Y41014-028 represent RGS regions of several

The gene sequence was isolated from a human thymus cDNA library by plaque hybridisation using the rat p26 cDNA sequence (V19303) at The screening isolated the corresponding 889 bp sequence. p26
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Fig 2; 40pp; Japanese.

C called pancreatic cancer antigens, given in B54008 to B54465. The human communomodulatory, relaxant, contraceptive, gynaecological, cardiant and cantinflammatory activities, and can be used in gene therapy. The complication of a medical condition or in assays for diagnosing a compartment to the proteins and the activity of the proteins can be used to gene therapy. The compartment to the proteins and the activity of the proteins can be compared to detect, treat compartments to the proteins and the activity of the proteins can be compared to the proteins and the activity of the proteins can be used to detect, treat compared to the antigens can be used to design nucleit cancer antigens can be used to design polynucleotides can be screened for. The pancreatic cancer antigen polynucleotides can be screened for. The pancreatic cancer composes that can be used to design nucleic acid hybridisation dentification and/or typing and a variety of forensic and diagnostic compared to the proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo cand in vitro diagnostic and therapeutic methods. The proteins can be used to treat or prevent neural, immune system, muscular, reproductive, considered to considered to consider the proteins can be considered to considered to consider the proteins can be considered to considered to considered to consider the proteins can be considered to considered t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is the amino acid sequence of a novel human regulator of Co-protein signalling, termed RGPS-2. It was deduced from a consensus nucleic acid sequence (see V45442) derived from thymus and other CDNA clones. RGPS-2 shares 46% and 37% identity with the capression in inflammed, immortalised or cancerous cells and tissues. The invention provides 2 regulators of G-protein tissues. The invention provides 2 regulators of G-protein capression in inflammed, immortalised or cancerous cells and tissues. The invention provides 2 regulators of G-protein capression in the invention provides 2 regulators of G-protein capression captains, i.e. RGPS-2 and RGPS-1 (see W30560). The invention calso features nucleic acids encoding RGPS polypeptides, coligonucleotides, peptide nucleic acids, fragments, portions or antisense molecules, and expression vectors and host cells. It also features antibodies specific for RGPS, and pharmaceutical compositions comprising purified RGPS. It also provides methods for stimulating cell proliferation using an RGPS or an agonist of RGPS and for treating or preventing disorders (e.g. cancer) associated with cell incoliferation and inflammation using an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The invention relates to isolated RGS-guanine nucleotide exchange factor CC (GEF) polypeptides. The novel isolated RGS-GEF polypeptide consists of an CC RGS domain of a GEF protein and does not comprise a dbl homology (PH) CC domain or a pleckstrin homology (PH) domain. The RGS-GEF polypeptides can be used for modulating an activity of a G protein alpha subunit (GAS). CC which a RGS-GEF polypeptide is involved, particularly pathological cc conditions, e.g. cell proliferation (e.g. cancer), morphogenesis, growth CC control, stress fiber formation, and integrin-mediated interactions, such CC as embryonic development, tumor cell growth and metastasis, programmed CC clot retraction, and the response of cells to mechanical stress. The CC products can also be used for detection, diagnosis and production of CC transgenic animals. Sequences Y41000-008 represent conserved domain
